PRACTICES

API Design System Design
CI/CD TDD GitOps
Microservices CQRS
Event-Driven Serverless

Weylin Wagnon

Fullstack | Backend | Platform | AI & Web

Let's build big, bold things, but let's never forget who we build them for

EXPERIENCE

Syntrologie AI | Lead Full Stack Engineer 2025 – Present

- Accelerated team velocity by architecting platform infrastructure from scratch — design system, B2B auth, CI/CD pipelines, and automated type generation across a Next.js / FastAPI microservices codebase with feature flags and experimentation
- Instituted security processes and runbooks across the full stack to ensure **SOC 2 compliance** for enterprise-level security, including automated regression testing, auditable workflows, and continuous vulnerability remediation
- Reduced production defects by building testing infrastructure from zero to **95% test coverage** across unit, component, and integration tests plus a Playwright E2E suite for post-deploy smoke validation in staging and production
- Authored **20+ prompt-engineered AI agent skills** that codified complex development workflows — adversarial code review, TDD enforcement, architecture documentation, multi-stage PR management, and infrastructure safety checks — into reusable, structured instructions that standardized engineering practices and reduced AI inference costs across the platform

Uplabs | Technical Hiring and Recruitment Consultant 2025

- Improved engineering hiring quality by building a recruitment and placement framework for senior and lead software engineers, reducing average time-to-hire across multiple client organizations and technical domains
- Increased new hire retention by designing structured onboarding programs with mentorship pairing, technical interview training for proctors, and cross-functional lead development across the organization
- Standardized technical assessments with reproducible evaluation criteria balancing deep technical skill, collaborative problem solving, and communication quality — adopted as the default hiring process across all open engineering roles

Coinbase (Contract) | Senior Software Engineer, Content 2024

- Reduced annual operating costs by over **\$100k** by streamlining the content modeling framework used across multiple contributing business units, editorial teams, localization workflows, and partner integration channels
- Eliminated hundreds of manual content workflows by building an automated content model management system with scripted migration tooling, schema validation, rollback support, and scheduled deployment pipelines
- Maintained zero downtime while coordinating high-throughput cache and firewall system replacement across several active contributing teams during peak traffic windows with phased rollout and real-time monitoring

Nivelo | Senior Software Engineer, Backend 2023

- Enabled reliable processing of **\$20M+ /month** in payroll transactions by managing critical API upgrades across the core backend transaction, validation, disbursement, and compliance reporting system
- Reduced deployment risk by architecting an internal application framework to incrementally modernize a legacy monolith into isolated, independently deployable service modules with shared contracts and versioned interfaces
- Improved junior developer growth and retention by establishing a structured senior-junior mentorship pairing program with regular code review sessions and quarterly goal tracking

LIBRARIES

SQLAlchemy GORM Pydantic
Axios Socket.io Pandas
NumPy Boto3

SERVICES

Stripe PayPal HyperWallet
Twilio Algolia CloudSearch
Contentful Sentry Datadog
Shopify Squarespace Stytych

ADDITIONAL SKILLS

Distributed Systems
Docker Compose Prometheus
Grafana OpenAPI OAuth Git
Playwright Pytest FFMPEG
Step Functions TensorFlow
PyTorch Scikit-Learn NLP

EDUCATION

UC San Diego

BS Human Biology

2008 – 2012

INTERESTS

Writing, trust engineering, HCI, distributed systems, poetry, typography, standup comedy, evolutionary psychology, behavioral economics, lockpicking, generative art, high fives after shipping

EXPERIENCE (CONT.)

One Finance | Senior Software Engineer, Platform

2021 – 2022

- Prevented over **\$40k/week** in fraud losses by implementing a machine learning detection API with TensorFlow, Python, and Flask that scored and flagged suspicious transactions against trained behavioral models in real time
- Mitigated large-scale credential stuffing attacks by developing a low-latency Go WAF service integrated with AWS WAF, Lambda, and Redis for automated rate limiting, IP reputation scoring, and threat blocking
- Increased deployment reliability across engineering by building and maintaining Kubernetes infrastructure for CI/CD pipelines using Terraform, GitOps, and Argo with automated rollback capabilities and canary deployments
- Strengthened code quality org-wide by integrating automated security scanning and approval standards through dynamic pipeline stages with configurable enforcement policies, audit logging, and exception workflows
- Improved engineer onboarding velocity as a member of the working group that designed and launched the structured training and mentorship program adopted by all engineering teams across the company

Whip Media | Backend Engineer, Golang

2019 – 2021

- Scaled API reliability to handle **30B+ requests/month** as lead developer for the public TVDB v4 API while maintaining full backward compatibility across v2 and v3 consumer integrations and partner applications
- Improved search performance and relevance across the platform by implementing large-scale distributed search systems with SQS, SNS, CloudSearch, and Algolia featuring real-time indexing, ranking, and synonym expansion
- Enabled advanced media data collection pipelines by building an automated keyframe generator service with FFMPEG and DynamoDB, processing content acquisition workflows spanning multiple upstream providers and formats
- Increased team agility and deployment speed by decomposing 2 cornerstone monolith applications into independently deployable, horizontally scalable microservice architectures with shared service contracts

Bitmob | Lead Engineer, Fullstack

2018 – 2019

- Grew product from zero code to **\$4M valuation** at exit by leading full-stack development of a software contracting marketplace built on React, Node, Express, Postgres, and AWS Lambda serverless functions
- Enabled contractor payments across multiple rails by building a unified remittance and disbursement system integrating HyperWallet, Stripe, and PayPal with automated reconciliation and transaction reporting
- Reduced cross-system event failures by implementing an AWS Step Function lambda flow architecture for long-lived cross-service workflow orchestration with retry logic and persistent state management
- Improved developer experience across the platform by engineering a performant bidirectional repository syncing system across GitHub, GitLab, and Bitbucket with automated conflict resolution and webhook notifications

Gravity Brands | Backend Software Engineer, Python

2017 – 2018

- Supported **\$45M/year** in e-commerce revenue by optimizing a high-volume Django and Node backend and leading the transition to a serverless AWS Lambda microservices architecture with API Gateway

Codesmith | Lead Instructor / Director of Machine Learning

2016 – 2017

- Created advanced ML course covering statistical and neural network models for mid-to-senior engineers

FACT | Adult Services Community Outreach Manager

2010 – 2016

- Automated health data collection, billing, and patient report generation by integrating the Google Apps platform across the organization
- Migrated health record system to a HIPAA-compliant database enabling on-site patient data documentation and real-time access
